IP Address	Most likely device type(s)	Rationale (why)	Confidence
192.168.10.1	DNS resolver / infrastructure server (resolver/cache)	PowerDNS Recursor on port 53 + SSH admin => clearly a DNS resolver appliance or VM used for DNS services.	High
192.168.10.20	Windows workstation / Windows print server **or** network printer (printer with JetDirect)	Services: SMB (135/139/445) + RDP (3389) suggest a Windows host; port **9100 (JetDirect)** also appears (printer protocol) — could be a workstation connected to/hosting print services or an MFP exposing SMB/RDP-like ports via a management interface.	Medium
192.168.10.25	Windows workstation / print server / MFP (same class as .20)	Same port set as .20; identical reasoning.	Medium
192.168.10.50	Linux server / admin host (SSH management host)	Only SSH open (OpenSSH 8.9) and Linux fingerprint — typical of a general-purpose Linux server or management/ Bastion host.	High
192.168.10.52	Windows workstation / print server / MFP (same family)	SMB/RDP/9100/10000 same pattern as other SMB/RDP devices — likely endpoints that provide SMB shares, remote desktop or printer services.	Medium
192.168.10.90	Windows workstation / print server / MFP	Same signature as other 10.x hosts with SMB/RDP and JetDirect.	Medium
192.168.10.180	Windows workstation / print server / MFP (or appliance)	SMB listed as `tcpwrapped` but RDP & JetDirect present — indicates an SMB-capable device (could be a Windows host or a managed printer/appliance).	Medium
192.168.10.181	Windows workstation / print server / MFP	Same port pattern as other hosts in the block.	Medium

192.168.10.200	File server (Samba) / Linux server with file shares	Samba smbd 4.6.2 on 139/445 + SSH -> strongly indicates a Linux file server offering SMB shares (possible NAS or Linux SMB server).	High
192.168.20.1	DNS resolver / infrastructure server	PowerDNS Recursor on port 53, same as 192.168.10.1 — infrastructure DNS role.	High
192.168.20.60	Multi-role server: web application / VPN / mail gateway / FTP server (general server)	Multiple server ports (21/25/443/1723/8080/8443) indicate a general-purpose server running web services, FTP/SMTP and possibly PPTP VPN.	Medium–High
192.168.20.61	Multi-role server (same family as .60)	Same set of service ports; likely same server cluster or similar application servers.	Medium
192.168.20.62	Multi-role server	Same as .60/.61.	Medium
192.168.20.74	Multi-role server	Same service footprint — likely part of same environment.	Medium
192.168.20.100	Web server / intranet application server	Apache 2.4.52 serving “ACME Intranet” on port 80 → explicit web application server.	High
192.168.20.110	Multi-role server (web/ftp/smtp/VPN)	Same multi-service ports as other 20.x hosts; OS detection inconclusive but role is server.	Medium
192.168.20.111	Multi-role server	Same service profile as sibling hosts.	Medium
192.168.20.222	Legacy service host / file & FTP server / + administrative host (high-risk legacy box)	vsftpd 2.3.4 (anon FTP allowed) + telnet + very old OpenSSH (4.7) + SMTP → classic legacy server or appliance left in production. High attack surface and outdated services.	High (as high-risk)
